# Multivariate problems and matrix algebra

*Lecture 1: November 2018, 23*

# Multivariate problems

**Multivariate statistical analysis** deals with data containing observations on two or more characteristics (variables) each measured on a set of objects (statistical units)

Example 1: examination marks, about 5 courses (Mechanics, Vectors, Algebra, Analysis, Statistics), achieved by 88 students

Example 2: weights of cork deposits (centigrams) for 28 trees in the four directions (N, E, S, W)

Example 3: flower measurements (sepal length, sepal width, petal length, petal width) on 50 flowers belonging to a certain species of iris

# Multivariate problems

Available information  $\rightarrow$  Dataset  $\rightarrow n \times k$  matrix

Example: data matrix with 5 students where  $X_1$ =age in years at entry to university,  $X_2$ =marks out of 100 in an examination at the end of the first year and  $X_3$ =sex.

	Variables		
units	$X_1$	$X_2$	$X_3$
1	18.45	70	1
2	18.41	65	0
3	18.39	71	0
4	18.70	72	0
5	18.34	94	1

# Multivariate problems

Some multivariate problems:

Example 1: study how the mark in the examination of «Statistics» (dependent variable) *is affected by or can be predicted as function of* the marks in other examinations or other variables such as age, sex, etc. (explanatory variables) → **regression problem**

Example 2: study how to combine the information on the performance of the students on the 5 examinations to determine the global performance of each student with just one, or two or less than 5 values → **factor analysis, principal component analysis, composite indicator**

Example 3: study how to group students with similar performances by considering the whole set of examinations → **cluster analysis**

# Multivariate problems

The general  $n \times k$  matrix which represents a dataset with  $n$  statistical units and  $k$  variables can be written as follows:

		Variables				
		$X_1$	...	$X_v$	...	$X_k$
Units						
1	}	$x_{11}$	...	$x_{1v}$	...	$x_{1k}$
...		...	...	...	...	...
u		$x_{u1}$	...	$x_{uv}$	...	$x_{uk}$
...		...	...	...	...	...
n		$x_{n1}$	...	$x_{nv}$	...	$x_{nk}$

This matrix can be denoted  $\mathbf{X}$  or  $(x_{uv})$

$$\mathbf{x}_u = \begin{pmatrix} x_{u1} \\ \dots \\ x_{uv} \\ \dots \\ x_{uk} \end{pmatrix}$$

$$\mathbf{x}_{(v)} = \begin{pmatrix} x_{1v} \\ \dots \\ x_{uv} \\ \dots \\ x_{nv} \end{pmatrix}$$

# Matrix algebra

A  $m \times n$  matrix  $A$  is a table with  $m$  rows and  $n$  columns:

$$\mathbf{A} = \begin{pmatrix} 3 & 8 & 3 & 5 \\ 9 & 1 & \textcircled{1} & 8 \\ 4 & 6 & 4 & 2 \end{pmatrix} \rightarrow a_{23} = 1$$

In this case the matrix has 3 rows and 4 columns. If  $m=n$  then it is called **square matrix**

# Matrix algebra

A matrix with dimension  $1 \times n$  is called **row vector**:

$$\mathbf{a}_{1 \times 5} = (6 \quad 3 \quad 1 \quad 7 \quad 2)$$

A matrix with dimension  $m \times 1$  is called **column vector** or simply vector:

$$\mathbf{c}_{5 \times 1} = \begin{pmatrix} 6 \\ 3 \\ 1 \\ 7 \\ 2 \end{pmatrix}$$

A **unit vector** is a vector of ones:

$$\mathbf{1}_{5 \times 1} = \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{pmatrix}$$

# Matrix algebra

Given the matrices  $\mathbf{A}$  and  $\mathbf{B}$ , their sum is defined as  $\mathbf{C}=\mathbf{A} + \mathbf{B}$ , where  $c_{ij} = a_{ij} + b_{ij}$

Example:

$$\mathbf{A} = \begin{pmatrix} 3 & 8 & 3 & 5 \\ 9 & 1 & 1 & 8 \\ 4 & 6 & 4 & 2 \end{pmatrix}, \mathbf{B} = \begin{pmatrix} 3 & 3 & 5 & 9 \\ 9 & 1 & 4 & 3 \\ 6 & 6 & 9 & 6 \end{pmatrix} \Rightarrow \mathbf{A} + \mathbf{B} = \mathbf{C} = \begin{pmatrix} 6 & 11 & 8 & 14 \\ 18 & 2 & 5 & 11 \\ 10 & 12 & 13 & 8 \end{pmatrix}$$

$a_{23} = 1$      $b_{23} = 4$      $c_{23} = 5$

# Matrix algebra

The product of a  $m \times n$  matrix  $\mathbf{A}$  and a scalar (single value)  $\lambda$  is called **scalar multiplication** and it consists in a matrix with the same dimension of  $\mathbf{A}$ , obtained by multiplying each element of  $\mathbf{A}$  by  $\lambda$

$$\mathbf{C} = \lambda \mathbf{A} \iff c_{ij} = \lambda a_{ij}$$

Example:

$$\lambda = 2 \qquad \mathbf{A} = \begin{pmatrix} 3 & 8 & 3 & 5 \\ 9 & 1 & 1 & 8 \\ 4 & 6 & 4 & 2 \end{pmatrix}$$

$$2\mathbf{A} = \begin{pmatrix} 6 & 16 & 6 & 10 \\ 18 & 2 & 2 & 16 \\ 8 & 12 & 8 & 4 \end{pmatrix}$$

# Matrix algebra

The **inner product** of two vectors **a** and **b** is possible if the vectors have the same number of elements and it is equal to  $\mathbf{a}'\mathbf{b} = \sum_i a_i b_i$

The **product between two matrices** A and B is possible if the number of columns of A is equal to the number of rows of B.

Given the  $m \times n$  matrix A and the  $n \times h$  matrix B, the product  $\mathbf{C}=\mathbf{A}\mathbf{B}$  is a  $m \times h$  matrix. The element in row i and column j is equal to the inner product between row i of A and column j of B.

$$\mathbf{C}=\mathbf{A}\mathbf{B} \Leftrightarrow c_{ij} = \mathbf{a}_i' \mathbf{b}_{(j)}$$

Example:

$$\mathbf{A} = \begin{pmatrix} 1 & 2 \\ -1 & 0 \\ 3 & 1 \end{pmatrix} \quad \mathbf{B} = \begin{pmatrix} 1 & 2 \\ 3 & 6 \end{pmatrix} \quad \longrightarrow \quad \mathbf{C} = \mathbf{A} \times \mathbf{B} = \begin{pmatrix} 7 & 14 \\ -1 & -2 \\ 6 & 12 \end{pmatrix}$$

# Matrix algebra

...where the elements of **C** are equal to:

$$\mathbf{C} = \begin{pmatrix} c_{11} = 1 \cdot 1 + 2 \cdot 3 = 7 & c_{12} = 1 \cdot 2 + 2 \cdot 6 = 14 \\ c_{21} = -1 \cdot 1 + 0 \cdot 3 = -1 & c_{22} = -1 \cdot 2 + 0 \cdot 6 = -2 \\ c_{31} = 3 \cdot 1 + 1 \cdot 3 = 6 & c_{32} = 3 \cdot 2 + 1 \cdot 6 = 12 \end{pmatrix}$$

# Matrix algebra

Note that:

$$\begin{matrix} \mathbf{A} & \cdot & \mathbf{B} & = & \mathbf{C} \\ (m \times n) & & (n \times h) & & (m \times h) \end{matrix}$$

Thus the product between a row vector and a column vector is a scalar; the product between a column vector and a row vector is a matrix:

$$\begin{matrix} \mathbf{a} & \cdot & \mathbf{b} & = & c \\ 1 \times n & & n \times 1 & & 1 \times 1 \end{matrix}$$

$$\begin{matrix} \mathbf{b} & \cdot & \mathbf{a} & = & \mathbf{C} \\ n \times 1 & & 1 \times n & & n \times n \end{matrix}$$

# Matrix algebra

Examples:

$$\mathbf{a}_{1 \times 2} = (2 \quad 4) \quad \mathbf{b}_{2 \times 1} = \begin{pmatrix} 5 \\ 2 \end{pmatrix} \quad \Rightarrow \quad \mathbf{a} \times \mathbf{b} = 2 \cdot 5 + 4 \cdot 2 = 18$$

$$\mathbf{b}_{2 \times 1} = \begin{pmatrix} 5 \\ 2 \end{pmatrix} \quad \mathbf{a}_{1 \times 2} = (2 \quad 4) \quad \Rightarrow \quad \mathbf{b} \times \mathbf{a} = \begin{pmatrix} 10 & 20 \\ 4 & 8 \end{pmatrix}$$

# Matrix algebra

The **transpose** of the matrix  $\mathbf{A}=(a_{ij})$  is the matrix  $\mathbf{A}'=(a_{ji})$  whose rows correspond to the columns of  $\mathbf{A}$ :

Example:

$$\mathbf{A} = \begin{pmatrix} 3 & 6 & 4 \\ 2 & 8 & 9 \\ 2 & 5 & 1 \end{pmatrix} \quad \mathbf{A}' = \begin{pmatrix} 3 & 2 & 2 \\ 6 & 8 & 5 \\ 4 & 9 & 1 \end{pmatrix}$$

The square matrix  $\mathbf{A}=(a_{ij})$  is **symmetric** if  $a_{ij}=a_{ji}$  or equivalently if  $\mathbf{A}' = \mathbf{A}$ .

Example:

$$\mathbf{A} = \begin{pmatrix} 3 & 6 & 4 \\ 6 & 8 & 9 \\ 4 & 9 & 1 \end{pmatrix}$$

# Matrix algebra

A **null matrix** is a matrix with all elements equal to 0.

$$\mathbf{0} = \begin{pmatrix} 0 & 0 & \cdot & 0 \\ 0 & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ 0 & 0 & \cdot & 0 \end{pmatrix}$$

A **diagonal matrix** is a square matrix whose elements not in the main diagonal are all equal to 0.

$$\text{diag}(a_1, \dots, a_n) = \begin{pmatrix} a_1 & 0 & \cdot & 0 \\ 0 & a_2 & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ 0 & 0 & \cdot & a_n \end{pmatrix}$$

# Matrix algebra

The transpose satisfies the following properties:

1.  $(A')' = A$
2.  $(A+B)' = A' + B'$
3.  $(AB)' = B'A'$

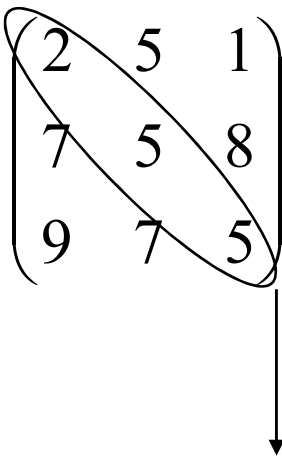

# Matrix algebra

The **trace** of  $\mathbf{A}=(a_{ij})$  is the sum of the elements in the main diagonal of  $\mathbf{A}$ :

$$tr(\mathbf{A})=\sum_i a_{ii}$$

Example:

$$\mathbf{A} = \begin{pmatrix} 2 & 5 & 1 \\ 7 & 5 & 8 \\ 9 & 7 & 5 \end{pmatrix} \quad tr(\mathbf{A}) = 2 + 5 + 5 = 12$$

Main diagonal

# Matrix algebra

The trace satisfies the following properties for

**A** ( $m \times m$ ), **B** ( $m \times m$ ), **C** ( $m \times n$ ), **D** ( $n \times m$ ) and a scalar  $\lambda$ :

1.  $\text{tr}(\lambda) = \lambda$
2.  $\text{tr}(\mathbf{A}) = \text{tr}(\mathbf{A}')$
3.  $\text{tr}(\mathbf{A} + \mathbf{B}) = \text{tr}(\mathbf{A}) + \text{tr}(\mathbf{B})$
4.  $\text{tr}(\mathbf{CD}) = \text{tr}(\mathbf{DC}) = \sum_{i,j} c_{ij} d_{ji}$
5.  $\text{tr}(\mathbf{CC}') = \text{tr}(\mathbf{C}'\mathbf{C}) = \sum_{i,j} c_{ij}^2$

# Matrix algebra

Given the  $2 \times 2$  matrix  $\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix}$

The **determinant** of  $\mathbf{A}$  is

$$\det(\mathbf{A}) = |\mathbf{A}| = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} = a_{11} \cdot a_{22} - a_{21} \cdot a_{12}$$

# Matrix algebra

Given the  $m \times m$  matrix  $\mathbf{A}$

The **determinant** of  $\mathbf{A}$  is

$$\det(\mathbf{A}) = |\mathbf{A}| = \sum_{j=1}^m a_{ij} A_{ij} = \sum_{i=1}^m a_{ij} A_{ij} \quad \text{for any } i, j$$

where the **cofactor**  $A_{ij}$  is the product of  $-1$  raised to the power of  $j+i$ :

$(-1)^{i+j}$  and the determinant of the matrix obtained after deleting  $i$ th row and  $j$ th column of  $\mathbf{A}$  (minor)

Case  $m=3$ :

$$\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix} \Rightarrow \det(\mathbf{A}) = |\mathbf{A}| = a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

$$= a_{11}(a_{22}a_{33} - a_{32}a_{23}) - a_{12}(a_{21}a_{33} - a_{31}a_{23}) + a_{13}(a_{21}a_{32} - a_{31}a_{22})$$

# Matrix algebra

Computation of the determinant of a 3<sup>rd</sup> order matrix (Sarrus rule):

$$\det(\mathbf{A}) = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix} = \begin{pmatrix} a_{11} & a_{12} & a_{13} & a_{11} & a_{12} \\ a_{21} & a_{22} & a_{23} & a_{21} & a_{22} \\ a_{31} & a_{32} & a_{33} & a_{31} & a_{32} \end{pmatrix} =$$

$$a_{11}a_{22}a_{33} + a_{12}a_{23}a_{31} + a_{13}a_{21}a_{32} - (a_{31}a_{22}a_{13} + a_{32}a_{23}a_{11} + a_{33}a_{21}a_{12})$$

# Matrix algebra

Example:

$$\mathbf{A} = \begin{pmatrix} 3 & 4 & 1 \\ 4 & 6 & 2 \\ 5 & 7 & 4 \end{pmatrix}$$

$$\det(A) = 3 \begin{vmatrix} 6 & 2 \\ 7 & 4 \end{vmatrix} - 4 \begin{vmatrix} 4 & 2 \\ 5 & 4 \end{vmatrix} + 1 \begin{vmatrix} 4 & 6 \\ 5 & 7 \end{vmatrix} = 3(24 - 14) - 4(16 - 10) + 1(28 - 30) = 4$$

or alternatively:

$$\det(\mathbf{A}) = \begin{pmatrix} 3 & 4 & 1 & 3 & 4 \\ 4 & 6 & 2 & 4 & 6 \\ 5 & 7 & 4 & 5 & 7 \end{pmatrix} =$$

$$= 3 \cdot 6 \cdot 4 + 4 \cdot 2 \cdot 5 + 1 \cdot 4 \cdot 7 - (5 \cdot 6 \cdot 1 + 7 \cdot 2 \cdot 3 + 4 \cdot 4 \cdot 4) =$$

$$= 140 - 136 = 4$$

# Matrix algebra

## Properties of the determinant

1. If  $\mathbf{A} = \text{diag}(a_1, \dots, a_n)$  then  $\det(\mathbf{A}) = a_1 \cdot a_2 \cdot \dots \cdot a_n = \prod_i a_i$
2.  $\det(\lambda \mathbf{A}) = |\lambda \mathbf{A}| = \lambda^n |\mathbf{A}|$
3.  $\det(\mathbf{AB}) = |\mathbf{AB}| = |\mathbf{A}| \cdot |\mathbf{B}|$
4. If  $\mathbf{A}$  has two equal rows or two equal columns then  $\det(\mathbf{A}) = 0$
5. If  $\mathbf{A}$  has a row of zeros or a column of zeros then  $\det(\mathbf{A}) = 0$
6.  $\det(\mathbf{A}) = \det(\mathbf{A}')$
7. If  $\mathbf{B}$  is the matrix obtained by exchanging the position of two rows or two columns of  $\mathbf{A}$ , then  $\det(\mathbf{B}) = -\det(\mathbf{A})$
8. If  $\mathbf{B}$  is the matrix obtained by summing to a row or a column of  $\mathbf{A}$  a linear combination of the other rows or columns of  $\mathbf{A}$  respectively then  $\det(\mathbf{B}) = \det(\mathbf{A})$
9. A square matrix  $\mathbf{A}$  is **non-singular** if  $\det(\mathbf{A}) \neq 0$ ; otherwise  $\mathbf{A}$  is singular

# Matrix algebra

Example:

$$\mathbf{A} = \begin{pmatrix} 2 & 3 \\ 1 & 6 \end{pmatrix} \quad \mathbf{B} = \begin{pmatrix} 2 & 5 \\ 7 & 3 \end{pmatrix}$$

$$\det(\mathbf{A}) = 2 \cdot 6 - 3 \cdot 1 = 9 \quad \det(\mathbf{B}) = 2 \cdot 3 - 5 \cdot 7 = -29$$

$$\det(\mathbf{A}) \cdot \det(\mathbf{B}) = 9 \cdot (-29) = -261$$

$$\mathbf{AB} = \begin{pmatrix} 2 & 3 \\ 1 & 6 \end{pmatrix} \cdot \begin{pmatrix} 2 & 5 \\ 7 & 3 \end{pmatrix} = \begin{pmatrix} 2 \cdot 2 + 3 \cdot 7 & 2 \cdot 5 + 3 \cdot 3 \\ 1 \cdot 2 + 6 \cdot 7 & 1 \cdot 5 + 6 \cdot 3 \end{pmatrix} = \begin{pmatrix} 25 & 19 \\ 44 & 23 \end{pmatrix}$$

$$\det(\mathbf{AB}) = 25 \cdot 23 - 19 \cdot 44 = -261$$

# Matrix algebra

The **inverse** of the square matrix  $\mathbf{A}$  is the unique matrix  $\mathbf{A}^{-1}$  satisfying:

$$\mathbf{A} \times \mathbf{A}^{-1} = \mathbf{I}$$

The diagram consists of two equations, one above the other, both with the identity matrix  $\mathbf{I}$  circled. Two arrows originate from the circled  $\mathbf{I}$  in the top equation and the circled  $\mathbf{I}$  in the bottom equation, both pointing towards the text 'diag(1)= Identity matrix' located to the right of the space between the two equations.

$$\mathbf{A}^{-1} \times \mathbf{A} = \mathbf{I}$$

diag(1)= Identity matrix

The inverse  $\mathbf{A}^{-1}$  exists if and only if  $\mathbf{A}$  is non singular, that is, if and only if  $\det(\mathbf{A}) \neq 0$ .

# Matrix algebra

The **identity matrix** is a diagonal matrix where all the elements in the main diagonal are equal to 1.

$$\mathbf{I} = \begin{pmatrix} 1 & 0 & \cdot & 0 & 0 \\ 0 & 1 & \cdot & 0 & 0 \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ 0 & 0 & \cdot & 1 & 0 \\ 0 & 0 & \cdot & 0 & 1 \end{pmatrix}$$

Properties of  $\mathbf{I}$

$$\mathbf{A} \times \mathbf{I} = \mathbf{I} \times \mathbf{A} = \mathbf{A}$$

$$\mathbf{A} \times \mathbf{A}^{-1} = \mathbf{I}$$

$$\mathbf{A}^{-1} \times \mathbf{A} = \mathbf{I}$$

# Matrix algebra

Properties of the inverse:

1.  $(\lambda \mathbf{A})^{-1} = \lambda^{-1} \mathbf{A}^{-1}$
2.  $(\mathbf{AB})^{-1} = \mathbf{B}^{-1} \mathbf{A}^{-1}$
3. The unique solution of  $\mathbf{Ax} = \mathbf{b}$  is  $\mathbf{x} = \mathbf{A}^{-1} \mathbf{b}$

$$4. \mathbf{A} = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \Rightarrow \mathbf{A}^{-1} = \frac{1}{a_{11}a_{22} - a_{12}a_{21}} \begin{pmatrix} a_{22} & -a_{12} \\ -a_{21} & a_{11} \end{pmatrix}$$

Example 1:

$$\mathbf{AB} = \begin{pmatrix} 2 & 3 \\ 1 & 6 \end{pmatrix} \cdot \begin{pmatrix} 2 & 5 \\ 7 & 3 \end{pmatrix} \Rightarrow (\mathbf{AB})^{-1} = \begin{pmatrix} 25 & 19 \\ 44 & 23 \end{pmatrix}^{-1} = \frac{1}{(-261)} \begin{pmatrix} 23 & -19 \\ -44 & 25 \end{pmatrix} = \begin{pmatrix} -0.088 & 0.073 \\ 0.169 & -0.096 \end{pmatrix}$$

$$\mathbf{B}^{-1} \mathbf{A}^{-1} = \begin{pmatrix} 2 & 5 \\ 7 & 3 \end{pmatrix}^{-1} \cdot \begin{pmatrix} 2 & 3 \\ 1 & 6 \end{pmatrix}^{-1} \Rightarrow \begin{pmatrix} -0.103 & 0.172 \\ 0.241 & -0.069 \end{pmatrix} \cdot \begin{pmatrix} 0.667 & -0.333 \\ -0.111 & 0.222 \end{pmatrix} = \begin{pmatrix} -0.088 & 0.073 \\ 0.169 & -0.096 \end{pmatrix}$$

# Matrix algebra

Example 2:

Let us consider the following system of equations

$$\begin{cases} 2x_1 + 3x_2 = 13 \\ x_1 + 2x_2 = 8 \end{cases} \Rightarrow \begin{pmatrix} 2 & 3 \\ 1 & 2 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} 13 \\ 8 \end{pmatrix} \Rightarrow \mathbf{Ax} = \mathbf{b}$$

The solution is

$$\begin{aligned} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} &= \begin{pmatrix} 2 & 3 \\ 1 & 2 \end{pmatrix}^{-1} \begin{pmatrix} 13 \\ 8 \end{pmatrix} = \frac{1}{2 \cdot 2 - 3 \cdot 1} \begin{pmatrix} 2 & -3 \\ -1 & 2 \end{pmatrix} \begin{pmatrix} 13 \\ 8 \end{pmatrix} = \\ &= \begin{pmatrix} 2 \cdot 13 - 3 \cdot 8 \\ -1 \cdot 13 + 2 \cdot 8 \end{pmatrix} = \begin{pmatrix} 26 - 24 \\ -13 + 16 \end{pmatrix} = \begin{pmatrix} 2 \\ 3 \end{pmatrix} \end{aligned}$$

# Matrix algebra

A square matrix  $\mathbf{A}$  is **orthogonal** if  $\mathbf{AA}' = \mathbf{I}$

The following properties hold:

1.  $\mathbf{A}' = \mathbf{A}^{-1}$
2.  $\mathbf{A}'\mathbf{A} = \mathbf{I}$
3.  $|\mathbf{A}| = \pm 1$
4.  $\mathbf{a}_i' \mathbf{a}_j = 0, i \neq j; \mathbf{a}_i' \mathbf{a}_i = 1, \forall i; \mathbf{a}_{(i)}' \mathbf{a}_{(j)} = 0, i \neq j; \mathbf{a}_{(i)}' \mathbf{a}_{(i)} = 1, \forall i;$

Example:

$$\mathbf{A} = \begin{pmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & -1 \end{pmatrix}$$

$$\mathbf{A}' = \begin{pmatrix} 0 & 1 & 0 \\ -1 & 0 & 0 \\ 0 & 0 & -1 \end{pmatrix} = \mathbf{A}^{-1} \text{ because } \mathbf{AA}' = \mathbf{I}$$

# PRACTICAL EXERCISES

SELECTION OF EXERCISES  
On the blackboard

Some simple operation with vectors using R

Create a vector v composed by 5 elements 1,2,3,4,5

# execute the following vectors operations and insert for each a comment about the result

```
s=sum(v)
```

```
s
```

```
p=prod(v)
```

```
p
```

```
cs=cumsum(v)
```

```
cs
```

```
cp=cumprod(v)
```

```
cp
```

Note: when you look for a command in R, simply write:  
help(COMMAND)

OR

?command

R classify the different variables as:

INTEGER, COMPLEX,

LOGICAL, CHARACTER

```
#numeric#
```

```
class(7.3)
```

```
class(3)
```

```
#integer#
```

```
k = as.integer(5)
```

```
k
```

```
class(k)
```

```
is.integer(k)
```

```
x=5.7
```

```
k=as.integer(x)
```

```
k
```

```
#complex e logical#
```

```
# COMMANDS:
```

```
== equal
```

```
>= greater or equal
```

```
<= lower or equal
```

```
>greater
```

```
< lower
```

```
!= different
```

R classify the different variables as:

INTEGER, COMPLEX,

LOGICAL, CHARACTER

```
z= 3>7
```

```
z
```

```
class(z)
```

```
u=TRUE;v= FALSE
```

```
u&v #u and v which results F #
```

```
#character#
```

```
name="valentina"
```

```
class(name)
```

```
x=as.character(14.25) #we define as character  
variable "14.25", so when we ask R will  
identify "14.25" as character
```

```
x
```

```
class(x)
```

```
#visualization of variables#
```

```
surname = "mini"
```

```
paste(name,surname) and observe the result
```

We create vector and matrix (see R lab)

# Complex algebra applied to multivariate statistics

# Matrix algebra

Vectors  $\mathbf{x}_1, \dots, \mathbf{x}_k$  are called **linearly dependent** if there exist numbers  $\lambda_1, \dots, \lambda_k$  not all zero such that  $\lambda_1\mathbf{x}_1 + \dots + \lambda_k\mathbf{x}_k = \mathbf{0}$ .  
Otherwise the  $k$  vectors are linearly independent.

Let  $\mathbf{W}$  be a subspace of  $\mathbf{R}^n$ . Then a basis of  $\mathbf{W}$  is a maximal linearly independent set of vectors.

Every basis of  $\mathbf{W}$  contains the same (finite) number of elements. This number is the dimension of  $\mathbf{W}$ .

If  $\mathbf{x}_1, \dots, \mathbf{x}_k$  is a basis for  $\mathbf{W}$  then every element  $\mathbf{x}$  in  $\mathbf{W}$  can be expressed as a linear combination of  $\mathbf{x}_1, \dots, \mathbf{x}_k$ .

Example:

The dimension of  $\mathbf{W} = \mathbf{R}^3$  is 3. A basis for  $\mathbf{R}^3$  is  $\mathbf{x}_1 = (1, 0, 0)'$ ,  $\mathbf{x}_2 = (0, 1, 0)'$  and  $\mathbf{x}_3 = (0, 0, 1)'$ . As a matter of fact  $\mathbf{x}_1$ ,  $\mathbf{x}_2$  and  $\mathbf{x}_3$  are linearly independent and every vector  $\mathbf{a} = (a_1, a_2, a_3)'$  can be expressed as linear combination of  $\mathbf{x}_1$ ,  $\mathbf{x}_2$  and  $\mathbf{x}_3$ :  $\mathbf{a} = a_1\mathbf{x}_1 + a_2\mathbf{x}_2 + a_3\mathbf{x}_3$

# Matrix algebra

The **rank** of a  $n \times k$  matrix  $\mathbf{A}$  is defined as the maximum number of linearly independent columns (rows) in  $\mathbf{A}$ .

The following properties hold for the rank of  $\mathbf{A}$ , denoted with  $r(\mathbf{A})$ :

1.  $r(\mathbf{A})$  is the largest order of those (square) submatrices of  $\mathbf{A}$  with non null determinants.
2.  $0 \leq r(\mathbf{A}) \leq \min(n, k)$
3.  $r(\mathbf{A}) = r(\mathbf{A}')$
4.  $r(\mathbf{A}'\mathbf{A}) = r(\mathbf{A}\mathbf{A}') = r(\mathbf{A})$
5. If  $n = k$  then  $r(\mathbf{A}) = k$  if and only if  $\mathbf{A}$  is non-singular

Example:

$$\mathbf{A} = \begin{pmatrix} 1 & -1 & 3 \\ -2 & 2 & 5 \\ 1 & -1 & 9 \end{pmatrix} \quad \det(\mathbf{A}) = 0 \quad \begin{vmatrix} 1 & -1 \\ -2 & 2 \end{vmatrix} = 0 \quad \begin{vmatrix} -1 & 3 \\ 2 & 5 \end{vmatrix} = -11 \neq 0$$

Thus the  $r(\mathbf{A}) = 2$

# Matrix algebra

If  $\mathbf{A}$  is a square matrix of order  $n$ , in some problems we are interested in finding a vector  $\mathbf{x}$  and a scalar  $\lambda$  which satisfy the following property:

$$\mathbf{A}\mathbf{x} = \lambda\mathbf{x} \implies (\mathbf{A} - \lambda\mathbf{I})\mathbf{x} = \mathbf{0}$$

The diagram illustrates the derivation of the eigenvalue equation. It shows the equation  $\mathbf{A}\mathbf{x} = \lambda\mathbf{x} \implies (\mathbf{A} - \lambda\mathbf{I})\mathbf{x} = \mathbf{0}$ . The term  $\mathbf{A}\mathbf{x}$  is circled, and an arrow points from the circle to the word "eigenvector". The term  $\lambda\mathbf{x}$  is also circled, and an arrow points from the circle to the word "eigenvalue".

A trivial solution is  $\mathbf{x}=\mathbf{0}$ , any  $\lambda \in \mathbf{R}$

# Matrix algebra

The  $n$  **eigenvalues** of  $\mathbf{A}$   $\lambda_1, \dots, \lambda_n$  are the  $n$  solutions of the characteristic equation

$$|\mathbf{A} - \lambda\mathbf{I}| = 0$$

Properties of the eigenvalues of  $\mathbf{A}$ :

1.  $|\mathbf{A}| = \prod_i \lambda_i$
2.  $tr(\mathbf{A}) = \sum_i \lambda_i$
3.  $r(\mathbf{A})$  equals the number of non-zero eigenvalues
4. The set of all eigenvectors for an eigenvalue  $\lambda_i$  is called the eigenspace of  $\mathbf{A}$  for  $\lambda_i$
5. Any symmetric  $n \times n$  matrix  $\mathbf{A}$  can be written as  $\mathbf{A} = \mathbf{\Gamma}\mathbf{\Lambda}\mathbf{\Gamma}' = \sum_i \lambda_i \gamma_{(i)} \gamma_{(i)}'$  where  $\mathbf{\Lambda}$  is a diagonal matrix of eigenvalues of  $\mathbf{A}$  and  $\mathbf{\Gamma}$  is an orthogonal matrix whose columns are eigenvectors with  $\gamma_{(i)}' \gamma_{(i)} = 1$

# Matrix algebra

Example:

$$\mathbf{A} = \begin{pmatrix} 2 & -2 & 3 \\ 1 & 1 & 1 \\ 1 & 3 & -1 \end{pmatrix}$$

The characteristic equation is:

$$\begin{vmatrix} 2-\lambda & -2 & 3 \\ 1 & 1-\lambda & 1 \\ 1 & 3 & -1-\lambda \end{vmatrix} = 0$$

By computing the determinant we have:

$$\begin{aligned} (2-\lambda) \cdot \begin{vmatrix} 1-\lambda & 1 \\ 3 & -1-\lambda \end{vmatrix} - 1 \cdot \begin{vmatrix} -2 & 3 \\ 3 & -1-\lambda \end{vmatrix} + 1 \cdot \begin{vmatrix} -2 & 3 \\ 1-\lambda & 1 \end{vmatrix} &= \\ = (2-\lambda)[-1+\lambda^2-3] - 2-2\lambda+9 - 2-3+3\lambda &= (\lambda+2)(\lambda-1)(3-\lambda) = 0 \end{aligned}$$

The solutions represent the 3 eigenvalues of  $\mathbf{A}$ :

$$\lambda_1 = 1 \quad \lambda_2 = -2 \quad \lambda_3 = 3$$

# Matrix algebra

The eigenvalue with maximum absolute value  $\lambda_3=3$  is called dominant

There is an infinite number of eigenvectors  $\mathbf{x}$  which satisfy  $(\mathbf{A}-3\mathbf{I})\mathbf{x} = \mathbf{0}$

$$\begin{pmatrix} -1 & -2 & 3 \\ 1 & -2 & 1 \\ 1 & 3 & -4 \end{pmatrix} \cdot \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

A possible solution is  $\mathbf{x} = (1, 1, 1)'$ , thus a standardized eigenvector is  $\left(\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)'$
