

MATLAB BASIC CHEAT SHEET

Basics

<code>clc</code>	Clear command window
<code>clear</code>	Clear all variables
<code>close all</code>	Close all plots
<code>help function</code>	Print help page for function
<code>% This is a comment</code>	Comments
<code>ctrl-c</code>	Abort the current operation
<code>format short</code>	Display 4 decimal places
<code>format long</code>	Display 15 decimal places

Defining and Changing Variables

<code>a = 3</code>	Define variable a to be 3
<code>x = [1, 2, 3]</code>	Set x to be the row vector $[1, 2, 3]$
<code>x = [1; 2; 3]</code>	Set x to be the column vector $[1, 2, 3]^T$
<code>A = [1, 2, 3, 4; 5, 6, 7, 8; 9, 10, 11, 12]</code>	Set A to be a 3×4 matrix
<code>x(2) = 7</code>	Change x from $[1, 2, 3]$ to $[1, 7, 3]$
<code>A(2,1) = 0</code>	Change $A_{2,1}$ from 5 to 0
<code>syms x</code>	Define variable x to be symbolic
<code>double(x)</code>	Convert x from symbolic to double
<code>subs(x)</code>	Replace all variables in the symbolic expression of x with their values taken from the MATLAB workspace

Constants

<code>pi</code>	$\pi = 3.141592653589793$
<code>NaN</code>	Not a number (i.e. $0/0$)
<code>Inf</code>	Infinity

Basic Arithmetic and Trigonometric Functions

<code>3*4, 7+4, 2-6, 8/3</code>	multiply, add, subtract and divide
<code>3^7</code>	Compute 3^7
<code>sqrt(5)</code>	Compute $\sqrt{5}$
<code>log(3)</code>	Compute $\ln(3)$
<code>log10(100)</code>	Compute $\log_{10}(100)$
<code>abs(-5)</code>	Compute $ -5 $
<code>sin(5*pi/3)</code>	Compute $\sin(5\pi/3)$, angle expressed in rad
<code>cos(pi/2)</code>	Compute $\cos(\pi/2)$, angle expressed in rad
<code>tan(pi/4)</code>	Compute $\tan(\pi/2)$, angle expressed in rad
<code>asin(0.5)</code>	Compute $\arcsin(0.5)$, result expressed in rad
<code>atan(3)</code>	Compute $\arctan(\pi/2)$, result in rad
<code>atan2(2,3)</code>	Compute $\arctan(2/3)$, result $\in [-\pi, \pi]$
<code>sind(300)</code>	Compute $\sin(300)$, angle expressed in deg
<code>cosd(90)</code>	Compute $\cos(90)$, angle expressed in deg

Complex Numbers (either numeric or symbolic)

<code>a = 4+i*3</code>	define a with 4 as the real part and 3 as the imaginary part
<code>abs(a)</code>	compute $ a $ (i.e. $\sqrt{4^2 + 3^2}$)
<code>angle(a)</code>	compute $\arg(a)$ (i.e. $\text{atan2}(3,4)$)

Constructing Matrices and Vectors

<code>zeros(12, 5)</code>	Make a 12×5 matrix of zeros
<code>ones(12, 5)</code>	Make a 12×5 matrix of ones
<code>eye(5)</code>	Make a 5×5 identity matrix
<code>linspace(0, 50, 1000)</code>	Make a vector with 1000 elements evenly spaced between 0 and 50
<code>0:10</code>	Row vector of 0, 1, ..., 9, 10
<code>0:0.001:50</code>	Row vector of elements from 0 to 50 with 0.001 step

Operations on Matrices and Vectors

<code>3 * x</code>	Multiply every element of x by 3
<code>x + 2</code>	Add 2 to every element of x
<code>x + y</code>	Element-wise addition of two vectors x and y
<code>A * y</code>	Product of a matrix and vector
<code>A * B</code>	Product of two matrices
<code>A ^ 3</code>	Square matrix A to the third power
<code>A .^ 3</code>	Every element of A to the third power
<code>exp(A)</code>	Compute the exponential of every element of A
<code>expm(A)</code>	Compute the exponential matrix of A (i.e. e^A)
<code>abs(A)</code>	Compute the absolute values of every element of A
<code>A'</code>	Transpose of A
<code>inv(A)</code>	Compute the inverse of A
<code>det(A)</code>	Compute the determinant of A
<code>eig(A)</code>	Compute the eigenvalues of A
<code>rank(A)</code>	Compute the rank of A

Entries of Matrices and Vectors

<code>x(2:12)</code>	The 2 nd to the 12 th elements of x
<code>x(2:end)</code>	The 2 nd to the last elements of x
<code>x(1:3:end)</code>	Every third element of x from the first to last
<code>A(5, :)</code>	Get the 5 th row of A
<code>A(:, 5)</code>	Get the 5 th column of A
<code>A(5, 1:3)</code>	Get the first to third elements in the 5 th row

Plotting

<code>plot(x, y)</code>	Plot y versus x (must be the same length)
<code>loglog(x, y)</code>	Plot y versus x on a log-log scale (both axes have a logarithmic scale)
<code>semilogx(x, y)</code>	Plot y versus x with x on a log scale
<code>semilogy(x, y)</code>	Plot y versus x with y on a log scale
<code>axis equal</code>	Force the x and y axes to be scaled equally
<code>grid on</code>	Add a grid to the plot
<code>hold on</code>	Multiple plots on single figure
<code>figure</code>	Start a new plot

Equations and Polynomials

<code>coeffs(x^2*x-1)</code>	Return the coefficients of a polynomial symbolic expression
<code>solve(x^2+x==0)</code>	Compute the solution of a symbolic equation
<code>solve([x1+x2==0;x2+6==0])</code>	Compute the solution of a system of symbolic equations

MATLAB SYMBOLIC AND CONTROL SYSTEM TOOLBOXES

Laplace Transform (Symbolic)

<code>dirac(t)</code>	Dirac impulse
<code>heaviside(t)</code>	Heaviside step function
<code>laplace(f(t))</code>	Compute the Laplace transform of a symbolic expression
<code>ilaplace(G(s))</code>	Compute the inverse Laplace transform of a symbolic expression

LTI Systems and Transfer Functions

<code>ctrb(A,B)</code>	Compute the controllability matrix
<code>obsv(A,C)</code>	Compute the observability matrix
<code>ss(A,B,C,D)</code>	Get the state-space representation of a LTI system
<code>tf(num,den)</code>	Get the transfer function given the coefficients of numerator and denominator
<code>tf(sys)</code>	Get the transfer function given the ss representation of a system
<code>[Num,Den]=ss2tf(A,B,C,D)</code>	Compute the coefficients of the transfer function of the A,B,C,D system
<code>s=tf('s')</code>	Define the laplace s variable as a transfer function
<code>pole(G)</code>	Compute the poles of the transfer function G
<code>zero(G)</code>	Compute the zeroes of the transfer function G
<code>dcgain(G)</code>	Compute the DC gain of the transfer function G (i.e. gain at zero frequency)
<code>damp(G)</code>	Print poles, natural frequencies and damping factors of G

Connected Systems and Responses

<code>parallel(G1,G2)</code>	Return the G1-G2 parallel connection
<code>series(G1,G2)</code>	Return the G1-G2 series connection
<code>feedback(G1,G2)</code>	Return the G1-G2 negative feedback connection
<code>impulse(G)</code>	Plot the impulse response of G
<code>impulse(G,t)</code>	Plot the impulse response of G in time t (t is a sampled vector)
<code>y=impulse(G)</code>	Return the impulse response of G as a column vector
<code>step(G)</code>	Plot the step response of G
<code>step(G,t)</code>	Plot the step response of G in time t (t is a sampled vector)
<code>y=step(G)</code>	Return the step response of G as a column vector
<code>step(G,popt)</code>	Plot the step response of G with specified time options (popt = timeoptions)
<code>stepinfo(G)</code>	Print the characteristics of the step response of G

PID Controllers (standard form)

<code>pidstd(Kp)</code>	Return a P controller
<code>pidstd(Kp,Ti)</code>	Return a PI controller
<code>pidstd(Kp,Inf,Td)</code>	Return a PD controller
<code>pidstd(Kp,Ti,Td)</code>	Return a PID controller

Root locus and Bode Plots

<code>rlocus(G)</code>	Plot the root locus of the transfer function G
<code>rlocus(G,k)</code>	Plot the root locus of G with given k values (k is a vector)
<code>bode(G)</code>	Plot the Bode diagrams of G (amplitude and phase)
<code>bode(G,w)</code>	Plot the Bode diagrams of G at given frequencies w (w is a vector)
<code>margin(G)</code>	Plot the Bode diagrams of G specifying the stability margin
<code>[Gm,Pm,Wpi,Wc]=margin(G)</code>	Return the gain (Gm) and phase (Pm) margins and the cross frequencies Wpi and Wc

Example: Root Locus

```
s = tf('s'); % Laplace variable
G = (s+5)/((s+1)*(s+2)*(s+8)); % Transfer function
rlocus(G) % Plot the root locus of G
```

Example: Bode

```
s = tf('s'); % Laplace variable
G = (s+5)/((s+1)*(s+2)*(s+8)); % Transfer function
bode(G) % Amplitude and phase Bode diagrams
```
